THE COST OF MENTAL ILLNESS:
ILLINOIS FACTS AND FIGURES

Hanke Heun-Johnson, Michael Menchine, Dana Goldman, Seth Seabury
May 2018
ILLINOIS
INTRODUCTION

Improving access to high-quality medical and behavioral health care for patients with mental illness remains one of the most vexing problems facing the health care system in the United States. Illinois is no exception, with some commentators reporting a mental health care “crisis” in the state.1

This chartbook attempts to quantify the magnitude of the challenges facing Illinois in terms of the economic burden associated with behavioral health issues. We describe the size and characteristics of the population with mental illness and show the impact on the health care system based on high rates of hospitalization. We also note the unmet need in terms of behavioral health care professionals and discuss the implications for the criminal justice system in Illinois.

INTRODUCTION

Key findings include:

• Illinois has a high rate of hospitalizations of patients with serious mental illness, which imposes a large cost on the health care system due to the relatively long length of stay, despite the general absence of procedures.
• Illinois’s state mental health agency spending per capita on community-based treatment programs is low in relationship to the U.S. average.
• Whereas Illinois has a high number of hospital beds available to provide inpatient care to patients with serious mental illness, there is a shortage of behavioral health care professionals, particularly in the criminal justice system.
• People living with mental illness are more likely to encounter the criminal justice system, resulting in a large number of arrests and incarcerations. The overall annual cost of incarcerating people with serious mental illness in state prisons in Illinois almost reaches $2 million.

The data presented in this chartbook are publicly available and represent the most recent numbers to which we had access. The term “behavioral health” is used to describe data related to mental illness and substance abuse, whereas “mental health” does not include substance abuse.

The data and methods are described in more detail in the appendix:

QUANTIFYING THE POPULATION LIVING WITH MENTAL ILLNESS IN ILLINOIS AND THE U.S.
KEY POPULATIONS OF INTEREST

SERIOUS PSYCHOLOGICAL DISTRESS (SPD)

When someone experiences serious psychological distress, he or she may have a diagnosed or undiagnosed mental health condition, such as major depressive disorder, bipolar disorder, or schizophrenia (described below). Serious psychological distress is determined by six questions on the Kessler-6 screening instrument, which measures the frequency of symptoms of depression, anxiety, and emotional distress during a specific time period.

MAJOR DEPRESSIVE DISORDER

A mental illness that severely impairs a person's ability to function, characterized by the presence of depressed mood, feelings of worthlessness, guilt, or helplessness, reduced concentration, ability to think, sleep problems, loss of interest or pleasure in activities, and/or recurrent thoughts of suicide.

BIPOLAR DISORDER

A mental illness characterized by extreme shifts in mood and energy levels. During manic episodes, a patient has abnormally high energy and activity levels that lead to impairment in daily functioning or requires hospitalization to prevent harm to self or others. Delusions or hallucinations can also occur. Manic episodes may be alternated with major depressive episodes.

SCHIZOPHRENIA

A debilitating mental illness that distorts a patient's sense of reality. Symptoms of schizophrenia include hallucinations, delusions, confusion, cognitive and mood impairments, and extremely disorganized thinking.

RISK FACTORS: GENETIC & EXTERNAL FACTORS

Many different genetic factors may increase risk, but no single genetic variation causes a mental illness by itself; Specific interactions between the individual's genes and environment are necessary for a mental illness to develop.
Many mental health conditions are fairly common in the general population.

Whereas any of these conditions can severely limit someone’s normal daily activities, three disorders are often labeled as **serious mental illness**: **major depressive disorder**, **bipolar disorder** and **schizophrenia**. These three disorders will be the focus of this chartbook.

NB: Due to symptom overlap, diagnoses of mental illnesses are not mutually exclusive.

Source: National Survey on Drug Use and Health (NSDUH) 2016 (SPD), NSDUH Mental Health Surveillance Study 2008-2012 (major depressive disorder) and National Institutes of Mental Health (other conditions – see appendix for original sources)
We estimate that more than one million adults in Illinois experienced serious psychological distress in the past 12 months.

Note that a patient can receive multiple diagnoses of a serious mental illness due to a high degree of overlap between the mental health conditions.

Source: National Institutes of Mental Health, National Survey on Drug Use and Health (NSDUH) 2016, and NSDUH-MHSS 2008-2012. Estimated number of people affected using total state population of 9,878,820 adults (18 years and over), Census Bureau data (2016)
Substance abuse in people with serious psychological distress

UNITED STATES 2016

People who experienced serious psychological distress in the past 12 months are more likely to abuse or be dependent on alcohol or illicit drugs during that same time period.

Source: National Survey on Drug Use and Health (2016)
Unmet mental health care needs

More than a quarter of adults with serious psychological distress in the past year reported an unmet need for mental health care. A common reason for not receiving care was the inability to afford mental health treatment, especially for people who do not have health insurance.
There is significant unmet need for mental health care in the U.S.

**UNITED STATES 2016**

Among adults who experienced **serious psychological distress** during the past year:

- **Unmet need: 27.3%**
- **Cannot afford: 41.3%**

27.3% indicates an unmet need of mental health treatment.

And 41.3% of these people did not receive mental health treatment, **because they could not afford it**.

More than a quarter of adults who experienced serious psychological distress in the previous year in the U.S. reported an unmet need for mental health care. Almost half of the people with a perceived unmet need reported that they did not receive treatment because they could not afford it.

Source: National Survey on Drug Use and Health (NSDUH) 2016
The extent to which cost was a factor in driving unmet need for mental health care varied by insurance status. People without health insurance were most affected by the inability to afford mental health treatment (75%), while those with VA/military health insurance coverage were least affected (13%).
MENTAL HEALTH CARE COVERAGE, UTILIZATION & COSTS

Medicaid & behavioral health care needs

Medicaid provides a safety-net for people with low income or qualifying disabilities, and a large percentage of people with Medicaid coverage experience behavioral health issues. However, it is often a financial burden for physicians to accept Medicaid patients since reimbursement rates are generally lower than for other patients. This can lead to access barriers for patients with Medicaid coverage that prevent them from receiving the behavioral health care they need.
People with mental illness have greater reliance on the safety net

UNITED STATES 2016

In the Medicaid and uninsured population, a higher percentage of people reported serious psychological distress (SPD) during the past year compared to people with Medicare, VA/military, or private health insurance coverage.

Source: National Survey on Drug Use and Health (NSDUH) 2016
Medicaid reimbursement rates to physicians are low

Low reimbursement rates are a disincentive for individual physicians to accept patients with Medicaid coverage and mental health problems. Compared to Medicare fee levels, Medicaid reimbursement rates are low in most states. Illinois has one of the lowest Medicaid-to-Medicare fee ratios, which may further limit physician’s willingness to accept Medicaid patients. This can be a barrier for these patients to obtain access to mental health care.

Source, Kaiser Family Foundation, Medicaid-to-Medicare Fee Index, FY 2016
For every 100 patients with a serious mental illness, there were approximately 47 hospitalizations in the U.S. in 2014. In Illinois this number is approximately 1.5 times higher. The average length of stay for these hospitalizations is long compared to other hospital stays. Relatively little progress has been made in reducing the length of stay for a serious mental illness over the last decade. This imposes a large financial cost on the health care system and potentially diverts resources away from other sites of care.
In Illinois, the number of hospitalizations of adults with schizophrenia, bipolar disorder, and major depressive disorder are approximately equal. However, patients with schizophrenia have a much higher rate of hospitalizations.

Compared to the rest of the U.S., hospitalization rates in Illinois for adults with serious mental illness are approximately 1.5 times higher.

4.5 % of all hospitalizations are due to SMI

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014

Estimate of hospitalization rate: based on total state population (Census bureau data, 2014) and prevalence estimates reported previously.
Length of stay for mental illness hospitalizations

ILLINOIS AND UNITED STATES 2014

The average hospital stay duration for adult patients with serious mental illness is high compared to all hospital stays, especially for patients diagnosed with schizophrenia.

The total time spent in the hospital by adults with a primary diagnosis of schizophrenia, bipolar disorder or major depressive disorder almost reaches half a million days each year in Illinois.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
In contrast to in adults, “psychotic disorder, not otherwise specified (NOS)” is diagnosed more often than schizophrenia in the younger population (1-17 years) during hospitalizations, possibly to prevent stigmatization.

When schizophrenia is the primary reason for a hospitalization, the average length of stay for younger people is one week longer than in adults, illustrating the challenges in treating and establishing an environment with appropriate follow-up care for this especially vulnerable population.
The length of stay in the hospital for serious mental illness in elderly patients is at least 20% higher on average than for younger adults with a similar diagnosis. Treatment of medical comorbidities due to aging, as well as difficulty finding long-term care environments may be at the root of this disparity.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
Trends in length of stay for schizophrenia hospitalizations

UNITED STATES 2000-2014

The average length of stay for a schizophrenia hospitalization was longer than those for kidney transplants, heart attacks or hip replacement surgeries. Moreover, the average duration for these other conditions all declined by at least 18% from 2000 to 2014 while for schizophrenia the duration increased slightly.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
Hospital costs in the U.S. and Illinois ranged from $4,800 to $9,000 per stay for patients with serious mental illness. This is despite a general absence of procedures or surgeries during a hospitalization for symptoms of serious mental illness.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
Total hospital costs for mental illness hospitalizations

ILLINOIS 2014

Total hospital costs
(all ages, in 2016 U.S.$)

- SMI total: $348,917,723
- Schizophrenia: $114,582,354
- Bipolar disorder: $119,580,585
- Major depressive disorder: $114,754,784

Total hospital costs in Illinois for hospitalizations for serious mental illness together almost reached $350 million in 2014.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
Total hospital costs for serious mental illness hospitalizations by insurance type

ILLINOIS 2014

Serious mental illness $349 million

- Medicaid 40%
- Medicare 32%
- Private insurance 24%
- Other 2%
- Uninsured 2%

All hospitalizations $16 billion

- Medicare 47%
- Medicaid 17%
- Private insurance 31%
- Other 1%
- Uninsured 4%

Compared to all hospitalizations, the expected payer for hospitalizations involving serious mental illness is much more likely to be Medicaid and less likely to be Medicare or a private insurer.

Only a small fraction of the $349 million in total hospitalization costs is covered by other programs (including VA/military health insurance), or paid by patients without health insurance.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014.

‘Other’ includes Worker’s Compensation, TRICARE/CHAMPUS, CHAMPVA, Title V, and other government programs. ‘Uninsured’ includes ‘self-pay’ and ‘no charge’.
For several decades, a shift from hospital inpatient care towards community-based clinic outpatient treatment has taken place, as is exemplified by the budget trends of state mental health agencies. On average, approximately 72% of their budgets is now spent on community-based programs, compared to 33% in the early 1980s. Compared to the U.S. average, the Illinois Department of Mental Health spends a very low amount per capita on community-based programs.
Illinois’s state mental health agency spends a very low per capita amount on mental health services, compared to the rest of the U.S.

Expenditures include (on average):
- 72% Community-based mental health programs funded and/or operated by state mental health agencies
- 26% Mental health services in state psychiatric hospitals
- 2% Administration/training/research/evaluation to support these services

Source: State Mental Health Agency-Controlled Expenditures for Mental Health Services, FY 2013 National Association of State Mental Health program Directors Research Institute, Inc (NRI)
In Illinois, the number of behavioral health care professionals is lower than the U.S. average. There are slightly more hospital beds and primary care physicians per capita than the national average. However, these average ratios are not optimal, and are not sufficient to serve the population with behavioral health needs.

In Illinois alone, 225 full-time professionals are needed in addition to the current workforce in designated “shortage areas” to reach an acceptable provider-to-patient ratio. This shortage is also acute in the criminal justice system, where many people are in need of behavioral health treatment.
There are 17 behavioral health care professionals for every 10,000 residents in Illinois, which is slightly lower than the average in the U.S. Note that the U.S. average does not represent the optimal number of behavioral health care professionals.

Behavioral health care professionals include: psychiatrists, psychologists, licensed clinical social workers, counselors, marriage and family therapists, and advanced practice nurses specializing in behavioral health care.

Source: County Health Rankings & Roadmaps, by the Robert Wood Johnson Foundation and the University of Wisconsin Population Health Institute.
Availability of behavioral health care professionals and hospital beds

ILLINOIS AND UNITED STATES 2013

Per resident, Illinois has fewer psychiatrists and psychologists compared to the U.S. average. However, Illinois has a higher number of primary care physicians and hospital beds dedicated to psychiatric care.

Although the optimal number of beds is unknown in our current health care infrastructure, there are estimates that 5 beds per 10,000 residents are minimally required assuming sufficient availability of outpatient programs for long-term treatment.

Source: Area Health Resource Files 2013 (psychiatrists, physicians and psychiatric care beds), and 2005-2013 Demographics of the U.S. Psychology Workforce, American Psychological Association (psychologists)
Shortage of behavioral health care professionals

ILLINOIS 2018

Currently, Illinois has 76 full-time equivalent behavioral health care professionals in designated shortage areas and facilities with behavioral health care professional shortages. In order to address the shortage issue, 225 more full-time professionals are needed in these areas, 13 of whom are needed in correctional facilities.

Source: Health Professional Shortage Areas (HPSA), HRSA Data Warehouse data as of 3/16/18

Behavioral health care professionals: psychiatrists, clinical psychologists, clinical social workers, psychiatric nurse specialists, and marriage & family therapists

Facilities: Federal & state correctional institutions, state & county mental hospitals, community mental health centers, and other public or nonprofit private facilities

Geographic high needs area based on population-to-provider ratio, poverty levels, elderly and youth ratio, alcohol and substance abuse prevalence, and travel time to nearest source of care outside area
Shortage of behavioral health care professionals in the Illinois region

Increase in shortage of behavioral health care professionals
2017-2018

The number of behavioral health care professionals needed to remove the shortage designation in Health Professional Shortage Areas is high in all states surrounding Illinois, especially in rural areas. However, Illinois has seen the highest increase in these shortages between 2017 and 2018.

The severity of the shortage on this map is measured on the Health Professional Shortage Area scale from 0 to 25, with 0 indicating no shortage, and 18 and above a severe shortage.
4,887,262 people in Illinois (38% of the state population) reside in designated shortage areas and/or are served by a facility with shortages of behavioral health care professionals. This is higher than the U.S. average of 30%.

Source: Health Professional Shortage Areas (HPSA), HRSA Data Warehouse, 03/16/2018, and Census Bureau data (2017)
MENTAL HEALTH CONDITIONS & THE CRIMINAL JUSTICE SYSTEM

People living with mental illness are more likely to encounter the criminal justice system and to be arrested, suggesting that mental illness is a factor in incarceration risk. Whereas state and federal prisons have resources to provide mental health care to prisoners who were not receiving this before incarceration, local jails appear particularly unable to meet the health care needs of people with mental illness.

The overall cost of incarceration of the 8000+ prisoners with serious mental illness in the state of Illinois exceeds $190 million per year.
People who experienced serious psychological distress (SPD) are more likely to have been arrested or be on parole or probation in the past year.

Source: National Survey of Drug Use and Health (NSDUH) 2016
Survey does not include current institutionalized population
A large percentage of the U.S. adult prison and jail inmate population currently experiences serious psychological distress compared to the non-institutionalized population.

Additionally, these mental health issues are observed at higher rates in local jails than in prisons.

Source: National Survey of Drug Use and Health (NSDUH) 2016
Bureau of Justice report: Sexual Victimization in Prisons and Jails Reported by Inmates, 2011-12, based on data from the National Inmate Survey
In Illinois state prisons, approximately 18% of prison inmates previously have been diagnosed with a serious mental illness, which is relatively low compared to the overall U.S. prison population. Many patients have been diagnosed with two or three mental illnesses, confirming the presence of overlap in symptoms in this population.

Source: Survey of Inmates in State Correctional facilities, BJS, 2004. Includes juveniles
Due to rounding, percentages of separate parts may not add up to the total percentage
The increase in mental health care treatment in federal and state prisons after admission to prison suggests that these institutions are making up for the gaps in mental health treatment in the general health care system.

At the same time, local jail inmates do not have the same access to medication and counseling while incarcerated as federal and state prisoners.

Mental health conditions include prior diagnosis of depressive disorder, bipolar disorder, and/or schizophrenia. Medication and counseling data includes treatment for any mental illness.

Source: SISFCF (Survey of inmates in states and federal correctional facilities) 2004 & SILJ (Survey of inmates in local jails) 2002
Estimated number of Illinois state prison inmates in 2016, previously diagnosed with serious mental illness:

8,202

Estimate of overall annual costs in 2016:

$ 193,276,365

(in 2016 U.S.$)

Overall annual costs based on 2016 average of all state prison inmates in Illinois

Survey of Inmates in State/Federal Correctional facilities, BJS, 2004
Illinois Department of Corrections - Fiscal Year 2016 Annual Report
TOTAL ECONOMIC BURDEN OF SERIOUS MENTAL ILLNESS

The economic burden of each serious mental illness in adults is estimated to be at least $35 billion for the U.S. and $1 billion for Illinois per year.
The economic burden of schizophrenia, bipolar disorder, and major depressive disorder in adults in Illinois is estimated to be at least $1.4 billion for each serious mental illness.

Due to symptom overlap, diagnoses of mental illnesses are not mutually exclusive, therefore, patients with two or more diagnoses may be represented in multiple categories.

Economic burden of serious mental illness

UNITED STATES 2016

Total economic burden of serious mental illness in the United States (in 2016 U.S.$)

- Schizophrenia: $35,438,281,577
- Bipolar disorder: $146,206,423,054
- Major depressive disorder: $214,745,157,719

The economic burden of schizophrenia, bipolar disorder, and major depressive disorder in adults in the U.S. is estimated to be at least $35 billion for each serious mental illness.

Due to symptom overlap, diagnoses of mental illnesses are not mutually exclusive, therefore, patients with two or more diagnoses may be represented in multiple categories.

Lost productivity is the largest contributor to economic burden of serious mental illness

Most of the total economic burden of serious mental illness is due to **lost productivity** (unemployment, lost compensation (incl. caregivers), or early mortality). Only 12 to 47% of the total burden is resulting from direct **medical costs** (including substance abuse treatment), and an even smaller percentage from law enforcement, incarceration, shelters, or research & training (**other costs**).

This highlights the large potential economic and societal benefits from improving treatment for serious mental illness even if it means spending more on care.
