THE COST OF MENTAL ILLNESS:
MASSACHUSETTS FACTS AND FIGURES

Hanke Heun-Johnson, Michael Menchine, Dana Goldman, Seth Seabury
September 2017
MASSACHUSETTS
INTRODUCTION

Improving access to high-quality medical care for patients with behavioral health conditions remains one of the most vexing problems facing the healthcare system in the United States. While Massachusetts’ health care system is considered to be among the nation’s top regarding access to health care, patients with serious mental health and substance use conditions may find themselves struggling to access care in a fragmented and underfunded system.

This chartbook attempts to quantify the magnitude of the challenges facing Massachusetts in terms of the economic burden associated with mental illness. We describe the size and characteristics of the population with behavioral health challenges and show the impact on the healthcare system based on high rates of hospitalization. We also note the unmet need in terms of mental health care providers, the rates of opioid misuse and overdoses, and discuss the implications for the criminal justice system in Massachusetts.
INTRODUCTION

Key findings include:

• In Massachusetts, patients with hospitalizations for serious mental illness have a relatively long hospital stay duration, which imposes a large cost on the health care system.

• Massachusetts’ per capita state mental health agency spending on community-based treatment programs is low relative to the U.S. average.

• Whereas Massachusetts has the highest per capita number of mental health care providers, shortages still exist in certain areas and facilities, particularly in correctional facilities.

• People living with mental illness are more likely to encounter the criminal justice system, resulting in a large number of arrests and incarcerations. The overall annual cost of incarcerating people with serious mental illness in state prisons in Massachusetts reaches almost $300 million.

• During the past decades, opioid misuse and dependency have increased steadily in the U.S., and even more so in Massachusetts, despite a recent reduction in prescription opioid sales. The increase in substance misuse and dependency has resulted in a large increase in fatal overdoses from opioids and heroin in the last several years.

The data presented in this chartbook are all publicly available and represent the most recent numbers to which we had access.

The data and methods are described in more detail in the appendix that can be found at: http://healthpolicy.usc.edu/Keck_Schaeffer_Initiative.aspx

38 OPIOID MISUSE AND FATAL OVERDOSES
QUANTIFYING THE POPULATION LIVING WITH MENTAL ILLNESS IN MASSACHUSETTS AND THE U.S.
Many mental health conditions are fairly common in the general population.

Whereas any of these conditions can severely limit someone’s normal daily activities, three disorders are often labeled as **Serious Mental Illness:** major depressive disorder, bipolar disorder and schizophrenia. These three disorders will be the focus of this chartbook.

NB: Due to symptom overlap, diagnoses of mental illnesses are not mutually exclusive.

Source: National Survey on Drug Use and Health (NSDUH) 2015 (SPD), NSDUH Mental Health Surveillance Study 2008-2012 (major depressive disorder) and National Institutes of Mental Health (other conditions – see appendix for original sources)
We estimate that more than half a million adults in Massachusetts experienced Serious Psychological Distress in the past 12 months.

Note that a patient can receive multiple serious mental illness diagnoses due to a high degree of overlap between mental health conditions.

Estimate of # of people affected using total state population of 5,407,228 adults (18 years and over), Census Bureau data (2015)
Medicaid reimbursement rates to physicians are low

MASSACHUSETTS AND UNITED STATES 2016

Low reimbursement rates are a disincentive for individual physicians to accept patients with Medicaid coverage and mental health problems. Compared to Medicare fee levels, Medicaid reimbursement rates are low in most states. Although Massachusetts’ fee ratio is higher than the U.S. average, Medicaid fees are still below Medicare fees. This can be a barrier for these patients to obtain access to mental health care.

Source, Kaiser Family Foundation, Medicaid-to-Medicare Fee Index, FY 2016
For every 100 patients with a serious mental illness, there were approximately 18 hospitalizations in the U.S. and 20 hospitalizations in Massachusetts in 2014. The average length of stay for these hospitalizations is long compared to other hospital stays. Relatively little progress has been made in reducing the length of stay for a serious mental illness over the last decade. This imposes a large financial cost on the health care system and potentially diverts resources away from other sites of care.
In Massachusetts, the number of hospitalizations is highest for adult patients with a principle diagnosis of bipolar disorder. However, patients with schizophrenia have a higher rate of hospitalizations.

The hospitalization rates in Massachusetts for adults with serious mental illness are similar compared to the U.S. average.

3.6% of all hospitalizations in Massachusetts are due to SMI
Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
Estimate of hospitalization rate: based on total state population (Census bureau data, 2014) and prevalence estimates reported previously
Length of stay for mental illness hospitalizations

The average hospital stay duration for adult patients with serious mental illness is relatively high in Massachusetts, and compared to all hospital stays, especially for patients diagnosed with schizophrenia.

The total time spent in the hospital by adults with a primary diagnosis of schizophrenia, bipolar disorder or major depressive disorder exceeds a quarter million days each year in Massachusetts.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
Hospitalizations of young patients with psychosis

In contrast to in adults, “psychotic disorder, not otherwise specified (NOS)” is diagnosed more often than schizophrenia in the younger population (1-17 years) during hospitalizations, possibly to prevent stigmatization.

Regardless of the primary reason for a hospitalization, the average length of stay for younger people in Massachusetts is approximately one week longer than for adults, illustrating the challenges in treating and establishing an environment with appropriate follow-up care for this especially vulnerable population.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
The average length of stay for a schizophrenia hospitalization in Massachusetts was longer than those for kidney transplants and heart attacks. Moreover, the average duration for these two other conditions declined by 22% and 23%, respectively, during the last two decades, while for schizophrenia the duration increased by 12%.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
Average hospital costs for mental illness hospitalizations

MASSACHUSETTS AND UNITED STATES  2014

Average hospital costs per stay
(all ages, in 2015 U.S.$)

Hospital costs in the U.S. and Massachusetts ranged from $5,000 to $16,000 per stay for patients with serious mental illness. This is despite a general absence of procedures or surgeries during a hospitalization for symptoms of serious mental illness.

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
The total hospital costs in Massachusetts for hospitalizations for serious mental illness exceeded $250 million in 2014. 

Source: Healthcare Cost and Utilization Project (HCUPnet) 2014
For several decades, a shift from hospital inpatient care towards community-based clinic outpatient treatment has taken place, as is exemplified by the budget trends of state mental health agencies. On average, approximately 72% of their budgets is now spent on community-based programs, compared to 33% in the early 1980s. Compared to the U.S. average, the Massachusetts’ state mental health agency spends a lower total amount per capita, but the amount of spending on community-based programs per capita is similar to the U.S. average.
Massachusetts’ state mental health agency spends a slightly lower per capita amount on mental health services compared to the U.S. average. However, the amount spent on community-based mental health programs is similar to the U.S. average.

Expenditures include (on average):
- 72% Community-based mental health programs funded and/or operated by state mental health agencies
- 26% Mental health services in state psychiatric hospitals
- 2% Administration/training/research/evaluation to support these services

Source: State Mental Health Agency-Controlled Expenditures for Mental Health Services, FY 2013 National Association of State Mental Health program Directors Research Institute, Inc (NRI)
AVAILABILITY OF MENTAL HEALTH CARE PROVIDERS

Massachusetts has the largest number of mental health care providers and hospital beds per capita in the U.S. However, to fully serve the population with mental health needs, there are still areas and facilities in Massachusetts that have a shortage of mental health care providers; 20 full-time providers are needed in addition to the current workforce in these designated “shortage areas” to reach an acceptable provider-to-patient ratio.

This shortage is particularly acute in the criminal justice system, where many people are in need of mental health treatment.
There are approximately 49 mental health care providers for every 10,000 residents in Massachusetts. This is the highest number in the U.S.

**Mental health care providers include:** psychiatrists, psychologists, licensed clinical social workers, counselors, marriage and family therapists, and advanced practice nurses specializing in mental health care.

*Source: County Health Rankings & Roadmaps, by the Robert Wood Johnson Foundation and the University of Wisconsin Population Health Institute.*
Availability of mental health care providers and hospital beds

MASSACHUSETTS AND UNITED STATES 2013

Per resident, Massachusetts has more psychiatrists, psychologists, and primary care physicians compared to the U.S. average, as well as a higher number of hospital beds dedicated to psychiatric care.

Source: Area Health Resource Files 2013 (psychiatrists, physicians and psychiatric care beds), and 2005-2013 Demographics of the U.S. Psychology Workforce, American Psychological Association (psychologists)
Currently, Massachusetts has 22 full-time equivalent mental health care providers in designated shortage areas. In order to address the shortage issue, 20 more full-time providers are needed in these areas, 15 of whom are needed in correctional facilities. 7.3% of the total population of Massachusetts resides in designated shortage areas (497,676 people).

Source: Health Professional Shortage Areas (HSPA), HRSA Data Warehouse data as of 1/1/2017
MENTAL HEALTH CONDITIONS & THE CRIMINAL JUSTICE SYSTEM

People living with mental illness are more likely to encounter the criminal justice system and to be arrested, suggesting that mental illness is a factor in incarceration risk. Whereas state and federal prisons have resources to provide mental health care to prisoners who were not receiving this before incarceration, local jails appear particularly unable to meet the health care needs of people with mental illness.

The overall cost of incarceration of the 2,000+ prisoners with serious mental illness in the state of Massachusetts reaches almost $300 million per year.
People who experienced Serious Psychological Distress (SPD) are more likely to have been arrested or be on parole or probation in the past year.

Source: National Survey of Drug Use and Health (NSDUH) 2015
Survey does not include current institutionalized population
Mental health issues in prison and jail populations

A large percentage of the U.S. adult prison and jail inmate population currently experiences Serious Psychological Distress compared to the non-institutionalized population. Additionally, these mental health issues are observed at higher rates in local jails than in prisons.

Source: National Survey of Drug Use and Health (NSDUH) 2015
Bureau of Justice report: Sexual Victimization in Prisons and Jails Reported by Inmates, 2011-12, based on data from the National Inmate Survey
In Massachusetts state prisons, approximately 27% of prison inmates have previously been diagnosed with a serious mental illness, which is high compared to the overall U.S. prison population. Many patients have been diagnosed with two or three mental illnesses, confirming the presence of overlap in symptoms in this population.

Source: Survey of Inmates in State Correctional facilities, BJS, 2004. Includes juveniles. Due to rounding, percentages of separate parts may not add up to the total percentage.
The increase in mental health care treatment in federal and state prisons after admission to prison suggests that these institutions are making up for the gaps in mental health treatment in the general health care system.

At the same time, local jail inmates do not have the same access to medication and counseling while incarcerated as federal and state prisoners.

Mental health conditions include prior diagnosis of depressive disorder, bipolar disorder, and/or schizophrenia. Medication and counseling data includes treatment for any mental illness.
Number of Massachusetts state prison inmates previously diagnosed with serious mental illness:

2,779

Overall annual costs in 2015:

$ 293,330,436

Overall annual costs based on 2015 average of all state prison inmates in Massachusetts

TOTAL ECONOMIC BURDEN OF SERIOUS MENTAL ILLNESS

The economic burden of each serious mental illness in adults is estimated to be at least $127 billion for the U.S. and $2.8 billion for Massachusetts per year.
The economic burden of schizophrenia, bipolar disorder, and major depressive disorder in adults in Massachusetts is estimated to be at least $2.8 billion for each serious mental illness.

Due to symptom overlap, diagnoses of mental illnesses are not mutually exclusive, therefore, patients with two or more diagnoses may be represented in multiple categories.

Economic burden of serious mental illness

UNITED STATES 2015

The economic burden of schizophrenia, bipolar disorder, and major depressive disorder in adults in the U.S. is estimated to be at least $127 billion for each serious mental illness.

Due to symptom overlap, diagnoses of mental illnesses are not mutually exclusive, therefore, patients with two or more diagnoses may be represented in multiple categories.

People who experience serious psychological distress are more likely to misuse or be dependent on alcohol, prescription opioids, and illicit drugs. During the past decades, the rates of opioid-related hospitalizations and emergency department visits have increased steadily in the U.S. and Massachusetts, despite a recent reduction in prescription opioid sales.

The increase in misuse and dependency has resulted in a large increase in fatal overdoses by opioids in the last several years.

Source: Healthcare Cost and Utilization Project (HCUP Fast Stats - Opioid-Related Hospital Use)
In 2005, 21% of opioid-related hospitalizations and ED visits in Massachusetts were by patients without health insurance. Since then, the health insurance situation has changed significantly, and this is exemplified by a change in payer type: In 2014, only 4% of opioid-related hospitalizations and ED visits were by patients without health insurance.

Source: Healthcare Cost and Utilization Project (HCUP Fast Stats - Opioid-Related Hospital Use)
Prescribing of opioids started to decrease in 2011

Between 1998 and 2011, average prescription opioid sales in the U.S. increased more than five-fold, followed by a decline in the last several years.

Prescription opioid sales in Massachusetts have followed the same trend, and have been slightly below the national average since 2007.

Source: Automation of Reports and Consolidated Orders System (ARCOS), Drug Enforcement Administration. United States data includes all states except DE, MO and PA.
Fatal overdoses by opioids are on the rise

Despite the moderate decline in opioid drug prescriptions in recent years, there has been an increase in the number of opioid overdose deaths in the United States. In Massachusetts, this recent increase in overdose deaths is even more pronounced than for the U.S. as a whole.

Source: Centers for Disease Control and Prevention, CDC Wonder – Multiple Cause of Death Data
Whereas the absolute number of fatal overdoses by heroin is still lower than overdoses by opioids in Massachusetts, the relative increase in the heroin overdose death rate between 2010 and 2015 is much higher (844%) than the increase in death rate due to opioids (301%).
